

# Water pollution

Made: Mátyás Leila Dominika

- On Earth we have less and less water, almost every sea, river is polluted.

- Many places in the seas huge garbage islands are formed from the slowly degradable wastes that cause many animals to die.
- There are materials that are slowly or not breaking down into the water- for example, metals, plastics.

- Pollution of the seas may occur from land or with pollutants transported by rivers.
- Oil tankers cause serious pollution.
- Rivers, lakes, seas are home to many animals and plants, but the quality of our waters deteriorates due to pollution, so it is not good for use and the animals living in it die.

- Unfortunately, Hungary is also involved in plastic pollution in World waters.
- The „Duna” carries almost 1500 tonnes of plastic in the Black Sea every year.

- Prevention of pollution is important.
- The people can help:
  - reduce, reuse, recycle
  - don't use nylon bag
  - use less plastic
  - pick up the rubbish

Thanks for watching my presentation.
